HSOP Platform Service Operations and Maintenance Runbook

1.0 Purpose

The purpose of this Operating and Maintenance Runbook is to provide operator with instructions on deploying & maintaining the HealthSuite OnPremise MicroCloud platform on AWS Outposts Full Form Factor. [Abstract]

2.0 Scope

This guide is a step-by-step process for the Operations Team completed by the HealthSuite On Premise MicroCloud platform <[Abstract]> deploying services on AWS Outposts Full Form Factor infrastructure.

This document specifically serves to guide those who will be maintaining, supporting, and using the services in day-to-day operational basis.

The following skill sets are required by the service engineers for deploying and supporting day-to-day activities.

Skills	Skill Level
Linux fundamentals	Basic
Terraform	Basic
Shell scripts	Basic
Git	Basic
Docker, Packer	Basic
kubernetes	Basic
CloudFoundry	Basic
AWS	Basic

3.0 Terms and Abbreviations

See the QMS Glossary [REF-1] for Terms and Abbreviations, commonly used in our QMS.

Terms & Abbreviations	Description/Definition
API	Application Program Interface
AWS	Amazon Web Services
D/R	Disaster / Recovery
GFS	Grandfather, Father, Son relationship
HSDP	HealthSuite Digital Platform Services
HSP	HealthSuite Platforms
HSOP	HealthSuite On Premise
MC	MicroCloud
IAM	Identity Access Management
IaaS	Infrastructure as a service (IaaS) is a form of cloud computing that provides virtualized computing resources over the internet.
I&S	Innovation and Strategy Platforms
IP&S	Intellectual Property and Standards
IQ/OQ	Installation Qualification and Operational Qualification
O&M	Operations and Maintenance
PaaS	Platform as a Service
P&R	Privacy & Regulatory
RTE	Release Train Engineer
RTO	Recovery Time Objective (RTO) is the length of time beginning when the service is first down after a failure or disaster occurs and ending when the Platform is restored to service in accordance with its specifications and all then current configuration documents. Please document your application RTO.

HSOP Platform Service Operations and Maintenance Runbook

Terms & Abbreviations	Description/Definition
RPO	Recovery Point Objective (RPO) is the length of time between data backup intervals for the purpose of maintaining data that might be lost from the service due to a major incident.
LDAP	Lightweight Directory Access Protocol
CF	Cloud Foundry

4.0 Overview of Solution

4.1. Overview Solution Architecture

HealthSuite OnPremise MicroCloud platform is a cloud foundry environment primarily meant to enable a harmonized development and continuous integration/continuous deployment (CI/CD) experience between the cloud and premises platforms.

4.2. Functional Solution Overview

Below diagram depicts the high-level architecture view of MicroCloud. Each layer provides key capabilities/functionality to MicroCloud.

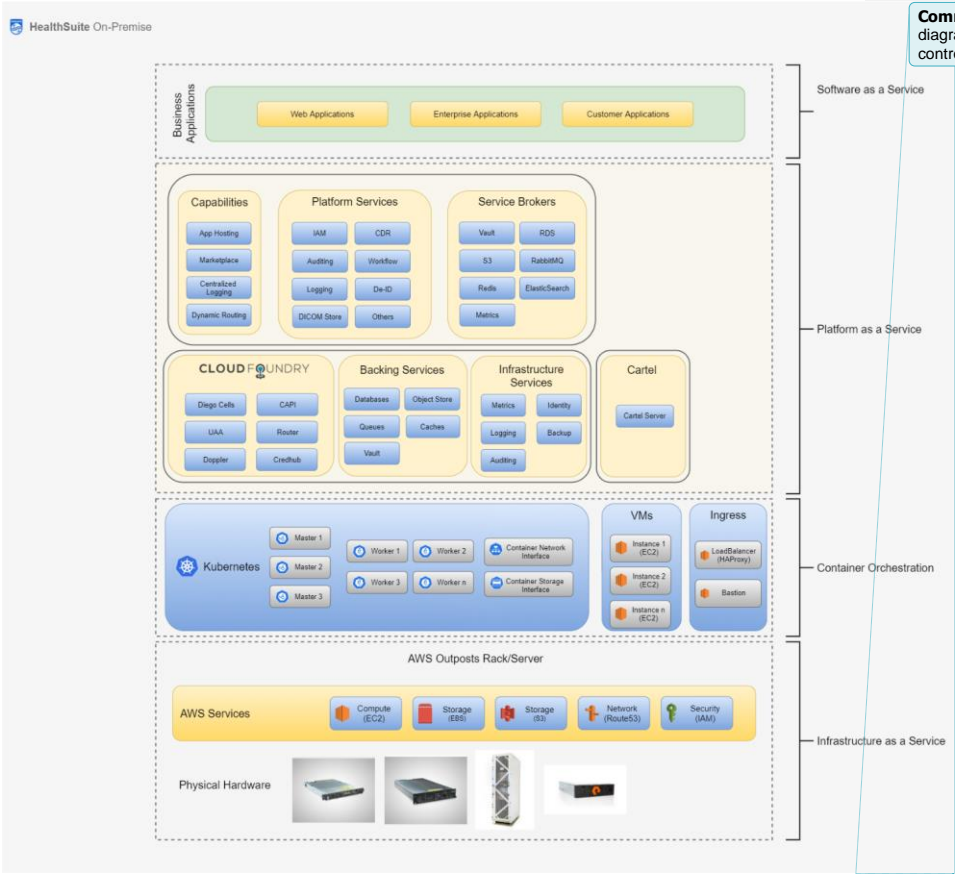

Note: HSOP MicroCloud v2.0 release is intended for non-commercial use.

HSOP Platform Service Operations and Maintenance Runbook

Commented [UT1]: Please replace with new HSOP diagram. There's a current one Vikram created for the export controls submission.

Physical layer: This layer is AWS Outposts Full Form Factor.

Infrastructure as a Service (IaaS): This layer provides services to provision required compute, storage, and resource requirements to host/deploy other layers.

IaaS layer abstracts underlying hardware, HSOP uses Terraform tooling to provision the infrastructure and configure required infrastructure services.

For Internal use only

HSOP Platform Service Operations and Maintenance Runbook

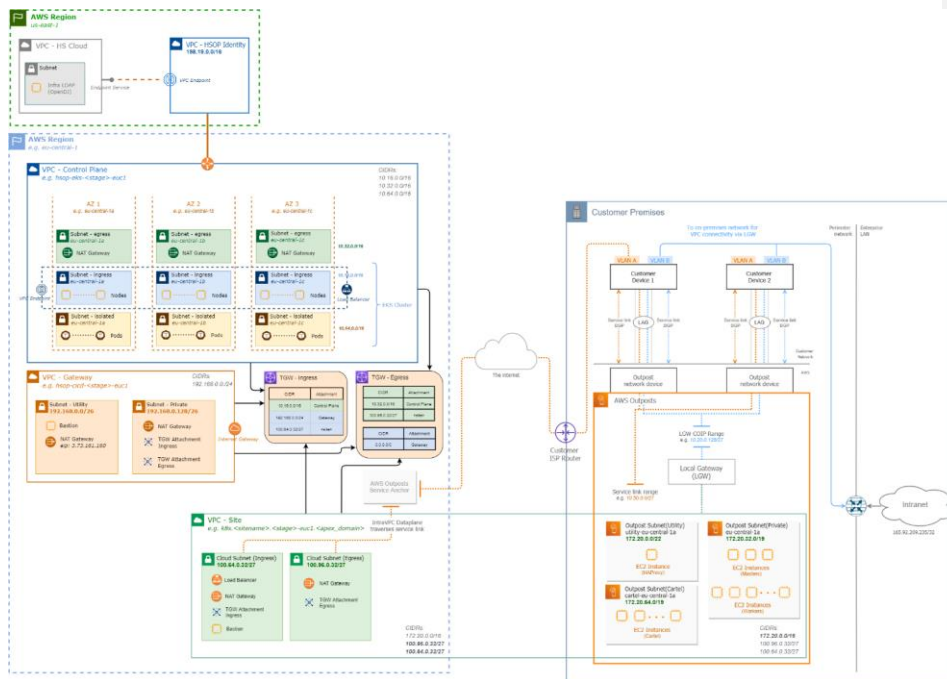

Container Orchestration Layer: This layer consists of a kubernetes distribution deployed on nodes provisioned by IaaS layer.

Containerized Cloud Foundry Layer: This layer leverages open-source CloudFoundry (CF) distribution for kubernetes called KubeCF

4.2.1. Physical Architecture/Deployment Model

MicroCloud deployment consist of following high level components

Components	Description
MicroCloud VPC	This VPC consist of all the assets required for provisioning of MicroCloud
Public Subnet	This subnet consists of Bastion entry point and Load balancer configured for MC. All the external interactions happen via this subnet
Private Subnet	This subnet consists of K8S and all MC deployment assets
kubernetes cluster	This is the primary backbone for the platform

Doc ID:	In DMS	Document title:	Classification:	For internal use

4.2.4. Capacity Management - Region Deployment

System	Configuration	EC2 Instance Count
Region eks cluster configuration		
worker node	m5a.xlarge	5
bastion	t3.micro	1

4.2.5. Kubernetes namespaces

Namespace	Description
kube-system	Standard kubernetes namespace.
minio	Namespace to hold pods for infrastructure minio(blobstore).
cf-mysql	Namespace to hold the mysql instance that contains cloudfoundry databases (cc db, uaa db etc.).
cert-manager	Namespace to hold cert-manager pods required for certificate generation & renewal.
certificate	Namespace to hold certificate (custom CRD) resource. Deployed on if use_external_certificate is false in the deployment profile.
cf-operator	Namespace to hold quarks resources required to bootstrap kubecf.
kubecf	Namespace to hold Cloudfoundry (cf-depoyment) resources.
monitoring	Namespace to hold resources required for monitoring the cluster. Include kube-promethues, alert-manager, grafana pods & services.
vault	Namespace to hold vault instance.
identity	Namespace to hold keycloak, openldap pods & services.
nginx-reverse-proxy	Namespace to hold nginx reverse proxy required node exporters on EC2 instances not managed by kubernetes.
dynamodb	Namespace to hold dynamodb local instance used to store broker state.
minio-s3	Namespace to hold minio instance used by the S3 service broker.
logging	Namespace to hold log drainer pods & services.
managed-redis	Namespace to hold redis instances provisioned by the hsdp-redis service broker.
managed-rds	Namespace to hold postgres & mysql instances provisioned by the hsdp-rds service broker.
managed-rmq	Namespace to hold RabbitMQ instances provisioned by the hsdp-rmq service broker.
managed-es	Namespace to hold Elasticsearch instances provisioned by the hsdp-elasticsearch service broker.
velero	Namespace to hold pods & services required for automatic backup of cluster resources.

5.0 Operations Procedures

The following sections cover aspects of installation, maintenance, monitoring and backup/recovery of the environment.

5.1. Event Based Access Management

Product team needs to be onboarded on the HSOP MicroCloud Platform & added to the level4-support group in LDAP. Refer [Add user to Group \(Only for Level 2, Level 3 Level 4 Users\)](#)

5.1.1. Deployment Role

level-3 support users as defined in [Add user to Group \(Only for Level 2, Level 3 Level 4 Users\)](#)

5.1.2. Monitoring Role

level-2 & level-3 support users as defined in [Add user to Group \(Only for Level 2, Level 3 Level 4 Users\)](#)

5.2. HSOP Region Installation Instructions

5.2.1. HSOP Prerequisites

- A valid domain name & the corresponding public Route53 Hosted Zone. Please note that the only one apex domain is required for HSOP & the Route53 Hosted Zone needs to be created only once across all regional deployments. An example of such a domain would be [hsop.io](#) or [hsop.hsdp.io](#).
- The AWS account used to deploy a HSOP region needs to have read/write access to the aforementioned apex zone.
- A valid email domain & the corresponding AWS SES configuration including the MX records in the aforementioned Route53 Hosted Zone of the apex domain. An example of such an email domain would be [mail.hsop.io](#) or [mail.hsop.hsdp.io](#).
- A git repository to manage site manifests files. Note that this repository can be created in either HSDP bitbucket ([bitbucket.hsdp.io](#)) or Philips inner source ([github.com/philips-internal](#)).

5.2.2. Installation Prerequisites

- One of the following POSIX environments on the system used for installation.
 - Mac OS (darwin)
 - Linux (Ubuntu 20.04 LTS)
 - Windows 10 64bit + WSL2 (Ubuntu 20.04 LTS)
- The following applications/tools are required to be installed on the system used for installation.

Doc ID:	In DMS	Document title:	Classification:	For internal use

- Internet connectivity with at least 100Mbps bandwidth.
- Ensure the linux user used for installation has password less sudo privilege enabled.
- Ensure that sufficient resources & quota are configured for the AWS account used to deploy HSOP. The required resources & quotas are described in section [Appendix – AE AWS Resource requirement & quotas](#).
- The following environment variables, with appropriate values, must be exported in the user shell. **As a security best practice, please do not add the environment variables to the bash profile or any persistent file.**

```
export AWS_ACCESS_KEY_ID=<your aws access key id>
export AWS_SECRET_ACCESS_KEY=<your aws secret access key>
export AWS_REGION=<the aws region>
export AWS_DEFAULT_REGION=<the aws region>
export PIP_EXTRA_INDEX_URL=<full url with secret to the HSDP pypi repository>
export PAGERDUTY_KEY=<pager duty key for alerts>
export SMTP_FROM=<from email address>
export SMTP_HOST=<email host smtp endpoint>:<port>
export SMTP_LOGIN=<email login username>
export SMTP_PASSWORD=<email login password>
export TWILIO_AUTH_TOKEN=<twilio auth token>
export TWILIO_SID=<twilio sid>
```

export APP_REGISTRY_USERNAME="<Docker registry username>"
export APP_REGISTRY_PASSWORD="<Docker registry password/token>"
```

- HSOP MicroCloud deployment requires an AWS account with access to the tethered region with admin permissions. The permissions required are outlined in [Appendix-A](#).

5.2.3. Regional Deployment Instructions

- Clone & checkout the version of HSOP MicroCloud platform source code that needs to be deployed.

```
mkdir -p hsop
cd hsop

git clone <repository_url> .
git checkout tags/<HSOP_version>

# For OPS dry run, use the following values for
# repository URL & the version tag.
git clone https://bitbucket.hsdp.io/scm/dep/hsonprem.git .
git checkout hsop_mc2.1_dryrun

# For production, use the following values for
# repository URL & the version tag.
git clone https://bitbucket.hsdp.io/scm/dep/hsonprem.git .
git checkout tags/v2.1.0 -b <new_branch_name>
```

- In the hsop directory where the repository has been cloned, change directory to

[source/deployment_region/regions](#).

```
cd source/deployment_region/regions/
```

- Copy the example deployment template provided as part of the [example-region-name](#) directory, in the [regions](#) directory, to a destination directory whose name matches the name of the AWS region where HSOP needs to be deployed.

```
cp -r example-region-name <aws_region_name>
# For example, to deploy in eu-central-1 region,
# run the following command.
# cp -r example-region-name eu-central-1
```

- Change directory to the newly copied directory, with intended region name & edit the [terragrunt.hcl](#) file with your favorite text editor.

Doc ID:	In DMS	Document title:	Classification:	For internal use
Modified:	In DMS	Platform Service Operations and Maintenance	Author:	In DMS
Version:	In DMS	Runbook Template	Approver:	In DMS
Status:	In DMS	Template ID: SNIP-T-060007.07 (Version 1.2)	Page:	18 of 55

HSOP Platform Service Operations and Maintenance Runbook

```
cd <aws_region_name>/
vi terragrunt.hcl
```

5. Provide appropriate values for the following variables in the [terragrunt.hcl](#) file.

```
apex_domain_name = "<the top level domain name>"
stage = "<provide a unique RFC 1738 compatible name>"
email = "<your email id>"
hs_cloud_ldap_service_name = "<HS Cloud LDAP Endpoint Service Name>"
hs_cloud_ldap_service_azs = ["Availability zones for the HS Cloud LDAP Endpoint Service"]
hs_cloud_ldap_service_fqdn = "<The fully qualified name of the HS Cloud LDAP instance>"
hsccloud_ldap_username = "<Username to authenticate with HS Cloud LDAP instance>"
hsccloud_ldap_password = "${get_env("HS_CLOUD_LDAP_PWD", "")}"
```

- a. Please note that the [hsccloud_ldap_password](#) variable is read from the environment variable [HS_CLOUD_LDAP_PWD](#) & should not be specified in the [terragrunt.hcl](#) file. Export the aforesaid environment variable before proceeding with deployment.

```
export HS_CLOUD_LDAP_PWD=<the HS Cloud ldap password>
```

6. Change directory back to [source/deployment_region](#) folder.

```
cd ../../
```

7. The deployment script for a new HSOP region is present in the current directory & is called [hsop](#).

- a. The region deployment script accepts the following arguments.

```
hsop v2.1.0
Usage: hsop [OPTIONS]
OPTION includes:
-U | --update - Create or update a HSOP region or site
-T | --teardown - Teardown existing HSOP region or site
-R | --region - Name of the HSOP region
-M | --modules - Comma separated list of modules to create or teardown.
Specify '*' to affect all modules
-v | --verbose - Make the operation more talkative
-V | --version - prints out version information of HSOP
-H | --help - displays this message
```

- b. The deployment script can be used to:

- deploy a new HSOP region
- update an existing HSOP region
- teardown an existing HSOP region

- c. The deployment process consists of the following discreet steps or modules that are executed in order shown below.

```
1. network
2. iam
3. bastion
4. transit-gateway
5. eks
6. loadbalancers
```

```

- Trigger deployment of a new region by running the following command.

```
./hsop --update --region <aws_region_name> --modules "+" --verbose
```

- The deployment of a new HSOP region takes approximately 2 to 3 hours depending on the network bandwidth available & other environment parameters. Upon successful completion, a new HSOP region is available for deployment of individual sites. See appendix for troubleshooting any errors you might encounter during deployment.

5.2.4. Post Installation Instructions

- Verify access to bastion host using your HS Cloud Idap credentials.

```
ssh -i /path/to/your/id_rsa \
-o "StrictHostKeyChecking no" \
<ldap_username>@bastion.<stage>-<aws_region_short_name>.<apex_domain>
```

- Enable other users access to the EKS cluster by following the instructions described in section [Appendix – V Provide access to other AWS IAM users after deployment of HSOP Control Plane \(or the regional EKS cluster\)](#).

5.2.5 Teardown Instructions

5.3. HSOP Site Installation Instructions

5.3.1. HSOP Site Installation Prerequisites

- One of the following POSIX environments on the system used for installation.
 - Mac OS (darwin)
 - Linux (Ubuntu 20.04 LTS)
 - Windows 10 64bit + WSL2 (Ubuntu 20.04 LTS)
- The following applications/tools are required to be installed on the system used for installation.

Application/Tool	URL	Version	Environment
git	link	2.34.1	All (darwin/linux/wsl2)
sshuttle	link	0.78.3	darwin/linux/wsl2
OpenSSH	link	latest	Windows 10
cf-cli	link	v6	All (darwin/linux/wsl2)
kubectrl	link	v1.22.3	All (darwin/linux/wsl2)

- Ensure that sufficient resources & quota are configured for the AWS account used to deploy HSOP. The required resources & quotas are described in section [Appendix – AE AWS Resource requirement & quotas](#).

For Internal use only

HSOP Platform Service Operations and Maintenance Runbook

- A text editor.
- Internet connectivity with at least 10Mbps bandwidth.
- A web browser

5.3.2. Capacity Management - Site

System	Configuration	EC2 Instance Count
Small Profile		
Bastion	t3.micro	1
Master	m5.large	1
Nodes	m5.2xlarge	6
HA Proxy	m5.xlarge	1
Medium Profile		
Bastion	t3.micro	1
Master	m5.large	3
Worker Nodes -1	M5.xlarge	3
Worker Nodes -2	M5.2xlarge	4
HA Proxy	m5.xlarge	1
Large Profile		
Bastion	t3.micro	1
Master	m5.large	3
Worker Nodes -1	M5.2xlarge	4
Worker Nodes -2	M5.4xlarge	1
HA Proxy	m5.xlarge	1
XLarge Profile		
Bastion	t3.micro	1
Master	m5.large	3
Worker Nodes -1	M5.2xlarge	2
Worker Nodes -2	M5.4xlarge	2
HA Proxy	m5.xlarge	1

5.3.3. Site Deployment Instructions

1. Clone the git repository where the site manifests are maintained. See section [HSOP Prerequisites](#).

```
# for example
git clone https://github.com/philips-internal/hsop-deployments.git
```

2. Checkout a new branch to add the manifest file for the site to be deployed.

```
git checkout -b feature_new_site_<sitename>
```

Doc ID:	In DMS	Document title:		Classification:	For internal use
Modified:	In DMS	Platform Service Operations and Maintenance Runbook Template		Author:	In DMS

Status:	In DMS	Template ID:	SNIP-T-060007.07 (Version 1.2)	Page:	21 of 55

HSOP Platform Service Operations and Maintenance Runbook

- Under the [regions](#) directory in the cloned git repo, create a new directory with the name of the region where the site is needed to be deployed if it does not exist.

```
cd regions
mkdir -p <aws_region_name>
# for example: mkdir -p eu-central-1
```

- Create a new site manifest yaml file under the region-specific directory (e.g. [eu-central-1](#)) that was created in the previous step & specify the site specific details as per the schema shown below. The specific information for a site should be filled in based on the details mentioned in the site onboarding JIRA ticket.

```
apiVersion: cd.cicd.hsop.io/v1
kind: Site
metadata:
  name: <name of the site as per RFC 1123/RFC 1035> # Required
spec:
  version: "<microcloud version to deploy, currently v2.1.0>" # Required
  stage: <stage name, e.g. dev,test,prod etc.> # Required
  outpost_id: <the outpost id to deploy microcloud stack> # Optional
  availabilityZones: # Required
    - <the availability zone of the outpost/deployment> # Required
  email: <email address of the person triggering the deployment> # Required
  plan: <the plan type - small,medium,large,xlarge> # Required
  type: <type of deployment - outpost,cloud> # Required
  operation: # Optional
    type: <type of operation to perform - update,teardown> # Optional
  modules: # Optional
    - <module name> # Optional
  network: <COIP configuration for LAN setup> # Optional
  subnet_routes: # Optional
    - <the subnet cidrs for LGW> # Optional
  ha_proxy: <the ipv4 pool name for HAProxy> # Optional
  pool: <the COIP address pool provided by the Hospital> # Optional
  demographics: <demographics of the customer location> # Optional
  fullName: <name of the customer facility> # Optional
  address: <address of the customer facility> # Optional
  contact: # Optional
    name: <name of the contact person> # Optional
    email: <email id of the contact person> # Optional
    telephone: <telephone number of the contact> # Optional
```

- Add & commit the newly created site manifest file to the git repository.
- ```
git add <new_site_manifest_yaml>
git commit -m "Deploy site <sitename>"
```
- Raise a pull request to merge changes from your feature branch created earlier to the master branch of the git repository.

Deployment of the new site will automatically begin upon successful merge of the new site manifest file to the master branch of the git repository. Note that the deployment of a new site takes approximately 3 to 4 hours.

### 5.3.4. Post Installation Instructions

1. Check the status of the newly deployed site as outlined in section [Appendix – AA Check status of a HSOP site](#) & verify that the value of the state attribute is **Up**. If the state attribute value is **Pending**, then check back again after some time.
2. Once the site deployment is complete & state attribute for the site is **Up** in ArgoCD UI, add users to the appropriate support groups in LDAP for the site as describe in section [Onboarding Users to support groups in LDAP for a site](#).

### 5.4. Tenant Lifecycle

#### 5.4.1. Onboarding Users to support groups in LDAP for the HSOP control plane

1. Access the central LDAP service for the region as described in section [Appendix – Z Access central LDAP instance in region](#).
2. Under the base DN, expand and select the entry named ou=Group.
3. Select the appropriate group for a site by clicking on the relevant child element under ou=Group.
  - a. Note that the names of the support groups for the control are not prefixed and are called level1-support, level2-support, level3-support, level4-support & platform-services-support.

4. Under uniqueMember field, click the (add value) link
5. In the popup window, expand the base DN and expand ou=People entry. Select the user you wish to add from the list.
6. Click Update object in the bottom of the screen and click Update object in the subsequent dialog.

#### 5.4.2. Onboarding Users to support groups in LDAP for a HSOP site

1. Access the central LDAP service for the region as described in section [Appendix – Z Access central LDAP instance in region](#).
2. Under the base DN, expand and select the entry named ou=Group.
3. Select the appropriate group for a site by clicking on the relevant child element under ou=Group.
  - a. Note that the names of the support groups for a site begin with the site name followed by a hyphen. For example, for a site called apollo, the following support groups exists under ou=Group.

|           |        |                                             |                 |                  |
|-----------|--------|---------------------------------------------|-----------------|------------------|
| Doc ID:   | In DMS | Document title:                             | Classification: | For internal use |
| Modified: | In DMS | Platform Service Operations and Maintenance | Author:         | In DMS           |
| Version:  | In DMS | Runbook Template                            | Approver:       | In DMS           |
| Status:   | In DMS | Template ID: SNIP-T-060007.07 (Version 1.2) | Page:           | 23 of 55         |

## HSOP Platform Service Operations and Maintenance Runbook

4. Under uniqueMember field, click the (add value) link
5. In the popup window, expand the base DN and expand ou=People entry. Select the user you wish to add from the list.
6. Click Update object in the bottom of the screen and click Update object in the subsequent dialog.
7. Note that it can take up to an hour for the permissions to reflect in the chosen site.

### 5.4.3. Onboarding Client Users to HSOP Platform

1. Access the central LDAP service for the region as described in section [Appendix – Z Access central LDAP instance in region](#).
2. Under the base DN, expand and select the entry named ou=Group.
3. Select the platform-services-support group for a site by clicking on the relevant child element under ou=Group.
  - a. Note that the names of the support groups for a site begin with the site name followed by a hyphen. For example, for a site called apollo, you'll find a group called cn=apollo-platform-services-support.
4. Under uniqueMember field, click the (add value) link
5. In the popup window, expand the base DN and expand ou=People entry. Select the user you wish to add from the list.
6. Click Update object in the bottom of the screen and click Update object in the subsequent dialog.
7. Note that it can take up to an hour for the user to reflect in Cloud Foundry at the chosen site.
8. Onboard the newly created user to Cloud Foundry.
  - a. Create a new Cloud Foundry Org & Space for the client if it does not exist as described in section [Appendix – AC Create new Cloud Foundry Org & Space in a HSOP site](#).
  - b. Assign Cloud Foundry Org & Space roles to the user as described in section [Appendix – AD Assign Cloud Foundry Org & Space roles to a User in a HSOP site](#).

## HSOP Platform Service Operations and Maintenance Runbook

### Prerequisites

- [kubectl v1.21.1](#)
- [kubelogin plugin](#)
- Kubernetes client id and secret from [Appendix-E Fetching kubernetes client id and Secret from Keycloak](#)

### Procedure

1. Run the command:

```
kubectl oidc-login setup --oidc-issuer-url
https://identity.cf.<domain>/auth/realms/hsop --oidc-client-id kubernetes --oidc-
client-secret <oidc-client-secret>
```

```
Set up the kubeconfig
Run the following command:
kubectl config set-credentials oidc \
 --exec-api-version=client.authentication.k8s.io/v1beta1 \
 --exec-command=kubectl \
 --exec-arg=oidc-login \
 --exec-arg=get-token \
 --exec-arg=--oidc-issuer-url=https://identity.cf.<DOMAIN_NAME>/auth/realms/hsop \
 --exec-arg=--oidc-client-id=xxx \
 --exec-arg=--oidc-client-secret=xxx
Verify cluster access
Make sure you can access the Kubernetes cluster.
kubectl --user=oidc get nodes
You can switch the default context to oidc.
kubectl config set-context --current --user=oidc
You can share the kubeconfig to your team members for on-boarding.
```

### 5.4.4. Offboarding a User

Offboarding of users is handled in the HS Cloud Infra LDAP.

### 5.4.5. Enabling / Disabling

N/A

|           |        |                                             |                 |                  |

## HSOP Platform Service Operations and Maintenance Runbook

### 5.5. Monitoring

#### 5.5.1. Accessing Grafana Dashboard

Grafana dashboard is integrated with ldap. So, the ldap user will be able to login to grafana dashboard with their username and password.

##### Prerequisites

- . Tunnel to the bastion host. Instructions are here in [Appendix](#)

##### Procedure

1. Navigate to the URL: **https://metrics.cf.< domain\_name>**
2. Login with the following credentials:
  - a. Username: <ldap username>
  - b. Password: <ldap password>
3. After successful login, Grafana homepage appears.
4. Navigate to **Manage** tab and the list of available dashboards would be listed
5. Click on any dashboard of interest to view the metrics. A sample dashboard metrics for alert manager is shown in [Appendix- I List of Dashboards](#)

#### 5.5.2. Alerting

Pager duty alerts are automatically triggered based on the configured rules.

A sample dashboard metrics for alert manager is specified in [Appendix-C Alert Resolution](#)

### 5.6. Service Recovery Plan

The Service Recovery plan provides detailed information to be considered in backup and disaster recovery of the HSOP Service.

#### 5.6.1. Backup Procedures

##### Backups

HSOP platform performs periodic backup to the cloud. [Velero](#) is used to schedule automated backups. The default backup frequency is once every 72 hours. The following table outlines the resources backed up, periodicity and retention.

| Resource | Schedule Name      | Periodicity/Frequency | Retention           |
|----------|--------------------|-----------------------|---------------------|
| Vault    | vault-backup       | 72 hours              | 360 hours (15 days) |
| RDS      | managed-rds-backup | 72 hours              | 360 hours (15 days) |

|           |        |                                                              |                 |                  |
|-----------|--------|--------------------------------------------------------------|-----------------|------------------|
| Doc ID:   | In DMS | Document title:                                              | Classification: | For internal use |
| Modified: | In DMS | Platform Service Operations and Maintenance Runbook Template | Author:         | In DMS           |
| Version:  | In DMS |                                                              | Approver:       | In DMS           |
| Status:   | In DMS | Template ID: SNIP-T-060007.07 (Version 1.2)                  | Page:           | 26 of 55         |

For Internal use only

## HSOP Platform Service Operations and Maintenance Runbook

| Resource               | Schedule Name              | Periodicity/Frequency | Retention           |
|------------------------|----------------------------|-----------------------|---------------------|
| Elasticsearch          | managed-es-backup          | 72 hours              | 360 hours (15 days) |
| Redis                  | managed-redis-backup       | 72 hours              | 360 hours (15 days) |
| RabbitMQ               | managed-rmq-backup         | 72 hours              | 360 hours (15 days) |

| KubeCF                 | kubecf-backup              | 72 hours              | 72 hours (3 days)   |

TODO: Info on CCDB encryption key – how it is stored and used..

### 5.6.2. Service Continuity

HSOP platform is comprised of a kubernetes cluster with CF running on it. Client provisioned, services and applications run on CF. It is necessary to be able to recover both the platform components and services as well as client applications and their data.

The Recovery Time Objective of the platform itself occurs after the restoration of underlying dependencies including Infrastructure as a Service. After the underlying infrastructure services have been restored, HSP Operations will work to restore the impacted HSOP Platform.

|           |        |                                             |                 |                  |

## HSOP Platform Service Operations and Maintenance Runbook

### 5.7. Upgrade and update

When we want to upgrade the kOps cluster, we need to mention that Kubernetes version in `/source/deployment_stable/k8s_version.txt` file.

E.g., if the current cluster has Kubernetes version of `v1.21.5` and we want to upgrade it to `v1.22.0`, we only need to update our `/source/deployment_stable/k8s_version.txt` file with the content `v1.22.0` in it.

Once we update this file, we should just run `kubernetes` module again where our `deploy.sh` script and `create_cluster.sh` script will compare the version mentioned in `k8s_version.txt` file and the current Kubernetes version of existing cluster. If there's mismatch found, kOps will update the cluster with the Kubernetes version mentioned in the `k8s_version.txt` file. Hence, we need to ensure that we mention the correct Kubernetes version in

### 6.0 Communications / Escalations

Each Service is required to maintain a list of engineers that are available to support the service. The individuals must be able to answer and resolve system level technical questions. HSOP utilizes an automated paging tool to meet this need. Please refer to team ENG-Microcloud and `eng-microcloud@hdp.pagerduty.com` in `hdp.pagerduty.com` for engineering contact details to allow the HSOP Operations and Support team access to resolve issues that may occur.

### 7.0 Service Key Performance Indicators (KPI)

| Item                    | Acceptable Objectives                                                                        | Ultimate Objectives                                                                          | Special Consideration |

## 14.0 Appendix-E Fetching kubernetes client id and Secret from

### Keycloak

Instructions for fetching secrets from keycloak.

1. Navigate to **Error! Hyperlink reference not valid.**
2. Login to keycloak with **keycloakadminuser** and **keycloakadminpassword** credentials obtained from [Appendix-D Fetching Secrets from Credhub](#)
3. On the left panel, navigate to **Clients** tab.

|           |        |                                             |                                |                 |                  |
|-----------|--------|---------------------------------------------|--------------------------------|-----------------|------------------|
| Doc ID:   | In DMS | Document title:                             |                                | Classification: | For internal use |
| Modified: | In DMS | Platform Service Operations and Maintenance |                                | Author:         | In DMS           |
| Version:  | In DMS | Runbook Template                            |                                | Approver:       | In DMS           |
| Status:   | In DMS | Template ID:                                | SNIP-T-060007.07 (Version 1.2) | Page:           | 35 of 55         |

4. Click **kubernetes** client on the table from the right panel.
5. Go to **Credentials** tab.
6. Copy the client secret from the field **Secret**.
7. The client id is **kubernetes** and client secret obtained from step 6 are the OIDC credentials required for authentication.

## 15.0 Appendix-H Procedure to Restore Failed Services from Components

### Prerequisites

- [Velero Client 1.6.3](#)
- Access to kubernetes cluster as mentioned in [Accessing kubernetes Cluster](#)

HSOP platform comprises of several components and services. Recovery can be effected, either for an individual service or for full platform. The specific service(s) selected for recovery is incumbent upon the diagnosis of the failure.

For example, a full cluster restore is needed only in the rare occurrence of a complete rack failure.

**Note:** Restore procedure requires admin access to the kubernetes cluster and can only be performed by Level-3 support engineer.

**Note:** For HSOP MicroCloud v2.0, restoration will be performed by Tier4(R&D). This will be facilitated by Tier3(Ops) by enabling temporary Tier3 access for the assigned Tier4 engineer.

### 15.1. Procedure for Individual Resource Restore

1. For a service selected for restore, look up the schedule name from [Backups](#).
2. Run the following command:  
**velero restore create <JOB\_NAME> --from-schedule <SCHEDULE\_NAME from Step 1>**
3. Wait for the completion of the restore job. Use the following command to view the status of the job:  
**velero restore get <JOB\_NAME>**
4. Repeat steps 1 - 3 for other failed services.

### 15.2. Procedure for Full Cluster Restore

1. Deploy HSOP platform as described in [Deployment Instructions](#).

|           |        |                                             |                 |                  |

## HSOP Platform Service Operations and Maintenance Runbook

2. Ensure the same baseline configuration is used as the previous deployment that needs to be restored.  
For example, use the same .tfvars file from the `hsonprem/source/deployment_stable/profiles` in the bitbucket repository as the previous deployment.
3. Execute the [Procedure for Individual Resource Restore](#) for the services ensuring the following order for restore.
  1. MySQL
  2. Minio(Infrastructure)
  3. Cert Manager
  4. CF Operator
  5. KubeCF
  6. Monitoring
  7. Vault
  8. Identity
  9. DynamoDB
  10. Logging
  11. Nginx
  12. Minio (Client)
  13. Redis
  14. RDS
  15. RabbitMQ
  16. Elasticsearch

### 15.3. Additional Instructions Post Recovery

Some of the services need additional steps to be performed post recovery or restoration of the service from backup. The following sections outline the additional steps required for these services. **The instructions are required to be followed only if the service mentioned below are restored.**

#### 15.3.1. Restore Monitoring

When the Monitoring service from the [Backup](#) services list is restored, the following additional steps need to be performed.

##### Prerequisites

- [Terraform 1.0.6](#)

|           |        |                                                                 |                                |                                                |

| Version:  | In DMS |                                                                 | Approver:                      | In DMS                                         |
| Status:   | In DMS | Template ID:                                                    | SNIP-T-060007.07 (Version 1.2) | Page: <a href="#">37</a> of <a href="#">55</a> |

## HSOP Platform Service Operations and Maintenance Runbook

- [cf cli v6](#)
- git (v2.17.1)
- Clone of HSOP source repository
- Export the following environment variables with appropriate values:
  - AWS\_ACCESS\_KEY\_ID, AWS\_SECRET\_ACCESS\_KEY, AWS\_REGION and AWS\_DEFAULT\_REGION.

### Procedure

The following steps need to be executed:

1. Navigate to the HSOP source repository folder.
2. Alert rules are not backed up need to be restored. Run the following commands to restore the alert rules.

```
cd scripts
./setup_env_vars.sh <PROFILE_FILE> # where PROFILE_FILE refers to the full
path of the profile file used for deployment.
cd ../modules/alerting/
terraform init -backend-config="bucket=$TF_VAR_bucket_name" -backend-
config="key=tfstate"
terraform select alerting-$TF_VAR_environment.$TF_VAR_domain_name
terraform taint null_resource.apply_alerting_rules
echo alerting > ../../configuration/mod.txt
export HSOP_CONF=mod
export HSOP_PROFILE=<PROFILE_NAME> # where PROFILE_NAME is the
PROFILE_FILE name
without extension
cd ../../
./deploy.sh
```

3. Restart the service proxy using the following commands.

```
cf l -a api.cf.$TF_VAR_domain_name -u <USERNAME> -p <PASSWORD> -o hsop -s
services
cf restart service-proxy
```

### 15.3.2. Restore Managed Service

When the services listed below from the [Backup](#) services list is restored, the following additional steps need to be performed.

| Resource/Service | Impacted kubernetes namespace | Service Broker name |
|------------------|-------------------------------|---------------------|
| Vault            | vault                         | vault-sb-app        |

|           |        |                                             |                 |                  |
|-----------|--------|---------------------------------------------|-----------------|------------------|
| Doc ID:   | In DMS | Document title:                             | Classification: | For internal use |
| Modified: | In DMS | Platform Service Operations and Maintenance | Author:         | In DMS           |
| Version:  | In DMS | Runbook Template                            | Approver:       | In DMS           |
| Status:   | In DMS | Template ID: SNIP-T-060007.07 (Version 1.2) | Page:           | 38 of 55         |

For Internal use only

## HSOP Platform Service Operations and Maintenance Runbook

|                |               |                    |
|----------------|---------------|--------------------|
| RDS            | managed-rds   | hsdp-rds           |
| Elasticsearch  | managed-es    | hsdp-elasticsearch |
| Redis          | managed-redis | hsdp-redis         |
| RabbitMQ       | managed-rmq   | hsdp-rabbitmq      |
| Minio (Client) | minio-s3      | hsdp-s3            |

### Prerequisite

- [cf cli v6](#)
- Access to kubernetes cluster as mentioned in [Accessing kubernetes Cluster](#)
- [jq v1.5](#)
- [yq v4.9.0](#)

### Procedure

Pick the kubernetes namespace and broker name from the table above for the impacted service & perform the following steps.

1. Export the kubernetes namespace name, service broker name and the domain name of the deployment as an environment variables.

```
export k8s_namespace=<kubernetes namespace from table>
export broker_name=<service broker name from table>
export domain_name=<domain name of the deployment>
```

2. Login to cloudfoundry with level3-support user credentials using the following command.

```
cf l -a api.cf.$domain_name -u <username> -p <password> -o hsop -s brokers
```

3. Update the service account token in the service broker and restage the service broker using the following commands.

```
cf set-env $broker_name K8S_BROKER_TOKEN \
$(kubectl -n $k8s_namespace get secret \
$(kubectl -n $k8s_namespace get secrets -o json | \
jq -r '.items[] | \
select(.metadata.annotations."kubernetes.io/service-
account.name"=="'{$k8s_namespace}'-deploy)" | .metadata.name') \
-o yaml | yq e '.data.token' -)
cf restage $broker_name
```

## HSOP Platform Service Operations and Maintenance Runbook

| Dashboard                            | Description                                                                           |
|--------------------------------------|---------------------------------------------------------------------------------------|
| Node Exporter / Nodes                | kubernetes node level metrics 1 - only kubernetes nodes                               |
| Node Exporter / USE Method / Cluster | kubernetes cluster level metrics - only kubernetes nodes                              |
| Node Exporter / USE Method / Node    | kubernetes node level metrics 2 - only kubernetes nodes                               |
| postgres-monitoring                  | This dashboard works with postgres_exporter to show postgres service specific metrics |
| rabbitmq-monitoring                  | Rabbitmq stats and alerting using RabbitMQ Exporter                                   |
| redis-monitoring                     | Redis Dashboard for redis service specific metrics                                    |
| vault-monitoring                     | Hashicorp Vault service specific metrics                                              |
| velero dashboard                     | This dashboard works with velero for velero specific metrics                          |
| minio-monitoring                     | minio service specific metrics                                                        |
| mysql-monitoring                     | mysql service specific metrics                                                        |
| Elasticsearch                        | NA                                                                                    |
| elasticsearch-monitoring             | NA                                                                                    |
| Elasticsearch complete               | Elasticsearch service specific metrics                                                |

## 17.0 Appendix-J Troubleshooting

### 17.1. Deployment

#### 17.1.1. Deployment of HSOP Region fails with errors

- Run the HSOP region deployment script again.  
`./hsop --update --region <aws_region_name> --modules "*" --verbose`
- If the issue persists, note down the module name where the error was encountered.
- Teardown the module in which the error occurred.  
`./hsop --teardown --region <aws_region_name> --modules <module_name> --verbose`
- Restart the HSOP region deployment.  
`./hsop --update --region <aws_region_name> --modules "*" --verbose`

#### 17.1.2. Deployment of HSOP Site fails with errors

- HSOP Site deployment can be retrigged by making a modification to the site manifest file & repeating the steps 5 through 6 of section [Site Deployment Instructions](#).  
**Note:** An insignificant change, for example updating the site address attribute with a comma, can be used to retrigger the deployment.

| Status:   | In DMS | Template ID: SNIP-T-060007.07 (Version 1.2)                  | Page:           | 41 of 55         |

### 17.1.3. Deployment fails with state is locked

To avoid inconsistencies due to multiple people trying to modify same infrastructure resources Terraform state file will be locked during deployment. At times for some reasons when deployment is abruptly stopped then there is a possibility of state lock being not released. In such cases any attempt to redeploy will fail with "Error acquiring the state lock".

Sample output will be like as follows, indicating who has locked the state and at what time:

```
Deploying module cloudfoundry ...
Acquiring state lock. This may take a few moments...
Error: Error acquiring the state lock

Error message: ConditionalCheckFailedException: The conditional request failed
Lock Info:
 ID: 60d991f2-500a-947a-eeed-59210ff5656a
 Path: hsop-us-west-2/env:/cloudfoundry-prod.cicd.hs-premise.com/tfstate
 Operation: OperationTypePlan
 Who: root@df057ebc73a5
 Version: 1.0.6
 Created: 2022-05-17 17:30:16.459697402 +0000 UTC
 Info:

Terraform acquires a state lock to protect the state from being written
by multiple users at the same time. Please resolve the issue above and try
again. For most commands, you can disable locking with the "-lock=false"
flag, but this is not recommended.

cloudfoundry plan failed.
```

- In such cases following command can be executed:
- `aws dynamodb delete-table --table-name <environment>.<domain name>`

## 17.2. Teardown

### 17.2.1. Error occurs during full teardown of a deployment

- Resume teardown by executing the `teardown.sh` script with `-f yes` argument  
`./teardown.sh -f yes`

### 17.3. kubectl command fails with the error - The connection to the server localhost:8080 was refused - did you specify the right host or port?

- Ensure [openssl](#) is installed on the system.
- Download certificate of the kubernetes cluster & save the base64 encoded certificate string to a file using the following command.

```
echo $(true | openssl s_client -connect api.k8s.<domain_name>:6443 2>/dev/null | openssl x509) | base64 | tr -d '\n' > k8s_ca_cert
```

- Edit the kube config file, located at `~/.kube/config`, to look like below.

```
apiVersion: v1
clusters:
- cluster:
 server: https://api.k8s.<domain_name>:6443 # domain name from profile
```

|           |        |                                             |                 |                  |
|-----------|--------|---------------------------------------------|-----------------|------------------|

```
file
 certificate-authority-data: <base64_encoded_certificate> # replace with
content of file k8s_ca_cert
 name: k8s.<domain_name> # domain name from profile file
contexts:
- context:
 cluster: k8s.<domain_name> # domain name from profile file
 user: oidc
 name: k8s.<domain_name> # domain name from profile file
current-context: "k8s.<domain_name>" # domain name from profile file
kind: Config
preferences: {}
users:
- name: oidc
 user:
 exec:
 apiVersion: client.authentication.k8s.io/v1beta1
 args:
 - oidc-login
 - get-token
 - --oidc-issuer-url=https://identity.cf.<domain_name>/auth/realms/hsop #
domain name from profile file
 - --oidc-client-id=<oidc_client_id> # oidc client id from keycloak
 - --oidc-client-secret=<oidc_client_secret> # oidc client secret from
keycloak
 command: kubectl
 env: null
 provideClusterInfo: false
```

- Export environment variable KUBECONFIG to point to the kube config file path as below.  
`export KUBECONFIG=~/.kube/config`
- Rerun the kubectl command.

### 17.4. ssh to bastion host fails with error - SSH Permission denied (publickey)

- Run the ssh command as follows.  
`ssh -o PreferredAuthentications=password -o PubkeyAuthentication=no <username>@bastions.<domain_name>`

### 17.5. Client requests to increase disk space/storage for a managed service

**Note:** Volume expansion requires admin access to the kubernetes cluster and can only be performed by Level-3 support engineer.

**Note:** For HSOP MicroCloud v2.0, volume expansion will be performed by Tier4(R&D). This will be facilitated by Tier3(Ops) by enabling temporary Tier3 access for the assigned Tier4 engineer.

- Login to kubernetes as level3 user, refer section [Accessing kubernetes Cluster](#).

## HSOP Platform Service Operations and Maintenance Runbook

- Enable volume expansion.

- Run the following command.

```
kubectl get sc ebs-sc --no-headers | awk '{ print $6 }'
```

- If the output of the previous command is *false*, run the following command.

```
kubectl patch storageclass \
 ebs-sc \
 --type='json' \
 -p='[{"op": "add", "path": "/allowVolumeExpansion", "value": true}]'
```

- Identify the persistent volume claim to be expanded from the below table.

- For managed services, except hsdp-s3 & hsdp-vault, login to cloudfoundry as level3 user & obtain the service guid.

```
cf service <service name> --guid # replace service name here
```

| Service             | kubernetes namespace | PVC name                                                                                  |
|---------------------|----------------------|-------------------------------------------------------------------------------------------|
| hsdp-s3             | minio-s3             | client-s3-minio                                                                           |
| hsdp-vault          | vault                | data-postgresql-postgresql-0                                                              |
| hsdp-redis-db       | managed-redis        | redisdb5-redis-<service guid>-0                                                           |
| hsdp-rds (postgres) | managed-rds          | postgreddb-postgres-<service guid>-0                                                      |
| hsdp-rds (mysql)    | managed-rds          | data-mysql-<service guid>-0                                                               |
| hsdp-rabbitmq       | managed-rmq          | see command below*                                                                        |
| hsdp-elastic        | managed-es           | see command below for service guid**<br>elasticsearch-data-es-<service guid>-es-default-0 |

\* run the below command to get pvc name for rabbitmq.

```
export SVC_NAME=$(kubectl -n managed-rmq get statefulset \
 -l cf_instance_id=<service guid> \
 -o yaml | yq e '.items.0.metadata.name' -)
```

```
kubectl -n managed-rmq \
 get pvc data- $\{SVC_NAME\}$ -0 \
 --no-headers -o custom-columns=":metadata.name"
```

\*\* run the below command to get service guid for elastic search.

```
cf service <service name> --guid | tr -d '-'
```

- Update the volume size with the following command.

```
kubectl patch pvc \
 <pvc name> \
 --namespace <namespace name> \
 -p '{"spec":{"resources":{"requests":{"storage":"<new size>Gi"}}}}'
```

- Restart the corresponding statefulset or deployment as per the below table, using the following command.

| hsdp-vault          | vault                | statefulset | postgresql-postgresql                                                |
| hsdp-redis-db       | managed-redis        | statefulset | redis-<service guid>                                                 |
| hsdp-rds (postgres) | managed-rds          | statefulset | postgres-<service guid>                                              |
| hsdp-rds (mysql)    | managed-rds          | statefulset | mysql-<service guid>                                                 |
| hsdp-rabbitmq       | managed-rmq          |             | see command below*                                                   |
| hsdp-elastic        | managed-es           |             | see command below for service guid**<br>es-<service guid>-es-default |

\* run the below command to get the statefulset name for rabbitmq.

```
export NAME=$(kubectl -n managed-rmq get statefulset \
-l cf_instance_id=<service guid> \
-o yaml | yq e '.items.0.metadata.name' -)
```

\*\* run the below command to get service guid for elastic search.

```
cf service <service name> --guid | tr -d '-'
```

### 17.6. Cluster is out of resources – CPU/Memory

**Note:** Cluster expansion requires admin access to the kubernetes cluster and can only be performed by Level-3 support engineer.

**Note:** For HSOP MicroCloud v2.0, volume expansion will be performed by Tier4(R&D). This will be facilitated by Tier3(Ops) by enabling temporary Tier3 access for the assigned Tier4 engineer.

- Run the following commands to extend the cluster.

```
Run the docker container
docker run --rm --mount src="$(pwd)",target=/deployment,type=bind -w /deployment -i -t hsop/driver:1.0 sh

Run the subsequent commands in the docker shell
```

|           |        |                                                              |                 |                  |
|-----------|--------|--------------------------------------------------------------|-----------------|------------------|
| Doc ID:   | In DMS | Document title:                                              | Classification: | For internal use |
| Modified: | In DMS | Platform Service Operations and Maintenance Runbook Template | Author:         | In DMS           |
| Version:  | In DMS |                                                              | Approver:       | In DMS           |
| Status:   | In DMS | Template ID: SNIP-T-060007.07 (Version 1.2)                  | Page:           | 45 of 55         |

For Internal use only

## HSOP Platform Service Operations and Maintenance Runbook

```
Set kubeconfig
export DOMAIN_NAME=<domain-name> # Replace the <domain-name> with value from
the profiles file
export KOPS_STATE_STORE=s3://<bucket-name>/kops # Replace <bucket-name> with
value from the profiles file
./modules/kubernetes/scripts/proxy_aware_kops_export_kubecfg.sh
k8s.$DOMAIN_NAME

Change directory to scripts folder
cd scripts
chmod +x extend_k8s_cluster.sh

Run cluster expansion script
./extend_k8s_cluster.sh -c all -p <profile-name> # Replace <profile-name> with
the name of the profile file without extension

Exit the docker container
exit
```

**Note:** If the cluster is extended already, you'll need to give a unique name for the *InstanceGroup* by editing the *extend\_cluster.tpl* file under *modules/extend-cluster* folder in line numbers 9 & 16.

### 17.7. Client requests for VM or Cartel instance

TODO: with APIs

## 18.0 Appendix- L Common kubectl commands

### 18.1. Command to find top memory consuming pods in a node

```
export NODE_NAME=<node> # Replace node name here
kubectl get po -A -o wide | grep ${NODE_NAME} | awk '{print $1, $2}' \
| xargs -n2 kubectl top pod --no-headers --use-protocol-buffers -n $1 \
| sort --key 3 -nr | column -t
```

### 18.2. Command to find top cpu consuming pods in a node

```
export NODE_NAME=<node> # Replace node name here
kubectl get po -A -o wide | grep ${NODE_NAME} | awk '{print $1, $2}' \
| xargs -n2 kubectl top pod --no-headers --use-protocol-buffers -n $1 \
| sort --key 2 -nr | column -t
```

## 19.0 Appendix- S IAM deployment prerequisites

On completion of MicroCloud deployment following pre-requisites required for IAM will be creates

|           |        |                                             |                 |                  |
|-----------|--------|---------------------------------------------|-----------------|------------------|
| Doc ID:   | In DMS | Document title:                             | Classification: | For internal use |
| Modified: | In DMS | Platform Service Operations and Maintenance | Author:         | In DMS           |
| Version:  | In DMS | Runbook Template                            | Approver:       | In DMS           |
| Status:   | In DMS | Template ID: SNIP-T-060007.07 (Version 1.2) | Page:           | 46 of 55         |

- K8S namespace by name "iam"
- Service account in the iam namespace with the following permissions
  - o Full permission for iam namespace
  - o Read permission for router-public secret in certificates namespace
- KubeConfig which can be used to deploy IAM will be available in vault at `cf/<secret-path>/<k8s.domainname>/iamkubeconfig` (refer section 14)
- Profile file used to deploy the HSOP can be used to get the details required to deploy the IAM

## 20.0 Appendix – U Setup SSH tunnel through the central Bastion host in a HSOP region

This section describes how to setup a SSH tunnel through the central Bastion host in a HSOP region, to access kubernetes, cloudfoundry & other services & applications running on-premises. The same steps can be used to also access the HSOP control plane EKS cluster that is deployed in a HSOP region.

### Prerequisites:

- [sshuttle 0.78.3](#) (for drawin/Linux/WSL2)
- Latest version of [OpenSSH](#) (for Windows only)

### Note:

If you are using WSL2 on Windows, sshuttle needs to be installed on the WSL2 Linux environment & OpenSSH should be installed on Windows.

### Commands to start the SSH tunnel:

#### sshuttle:

In a terminal window, run the following command. Note, you can omit the `--daemon` flag to run sshuttle as a foreground/blocking process.

```
sshuttle --dns --daemon -vr \
 <ldap_username>@bastion.<stage>-<aws_region_short_name>.<apex_domain> \
 10.16.0.0/16 100.64.0.0/10 \
 --ssh-cmd 'ssh -i /path/to/your/id_rsa -o "StrictHostKeyChecking no"'
```

### OpenSSH:

In a command prompt window, run the following command.

```
ssh -o "StrictHostKeyChecking no" -N -D <proxy_port_number> ^
-i drive_letter:\path\to\your\id_rsa ^
<ldap_username>@bastion.<stage>-<aws_region_short_name>.<apex_domain>
```

**Note:** The above command runs a SOCKS proxy to tunnel via the Bastion host. In order to use the tunnel, you'll need to configure Windows to use the SOCKS proxy for all HTTP communication. Run the following command in a Windows command prompt.

```
netsh winhttp set proxy ^
proxy-server="socks=localhost:<proxy_port_number>" ^
bypass-list="localhost"
```

### Commands to stop the SSH tunnel:

#### sshuttle:

|           |        |                                             |                 |                  |
|-----------|--------|---------------------------------------------|-----------------|------------------|
| Doc ID:   | In DMS | Document title:                             | Classification: | For internal use |
| Modified: | In DMS | Platform Service Operations and Maintenance | Author:         | In DMS           |
| Version:  | In DMS | Runbook Template                            | Approver:       | In DMS           |
| Status:   | In DMS | Template ID: SNIP-T-060007.07 (Version 1.2) | Page:           | 47 of 55         |

For Internal use only

## HSOP Platform Service Operations and Maintenance Runbook

In a terminal window, run the following command.

```
kill --signal SIGTERM sshuttle
```

**Note:** Do not use `SIGKILL(9)` as this can leave the iptables in an inconsistent state forcing a system restart. Always use `SIGTERM(15)`.

### OpenSSH:

- Close the windows where the OpenSSH command for starting the SOCKS proxy was run.
- Reset the Windows proxy environment settings by running the following command in a command prompt window.

```
netsh winhttp reset proxy
```

## 21.0 Appendix – V Provide access to other AWS IAM users after deployment of HSOP Control Plane (or the regional EKS cluster)

This section describes how to provide additional AWS IAM users access to the regional EKS cluster.

### Prerequisites:

- [aws-cli version 2.2.4](#) (for all Operating Systems)
- [sshuttle 0.78.3](#) (for drawin/Linux/WSL2)
- Latest version of [OpenSSH](#) (for Windows only)
- [kubectl v1.22.3](#) (for all Operating Systems)

### Steps:

1. Perform the steps described in section [Appendix – W Access HSOP Control Plane \(regional EKS cluster\)](#).
2. Update the **aws-auth ConfigMap** in `kube-system` namespace with the user you wish to add using the following command.

```
USER=" - userarn: <arn_of_the_aws_iam_user_to_add>\n username: admin\n groups:\n - system:masters"\nkubectl get -n kube-system configmap/aws-auth -o yaml | awk "/mapUsers:\n\\|/{print;print \"\\$USER\\\";next}1" > /tmp/aws-auth-patch.yml\nkubectl patch configmap/aws-auth -n kube-system --patch "$(cat /tmp/aws-auth-patch.yml)"
```

**Note:** The above command assumes that the `mapUsers` attribute exists in the **aws-auth ConfigMap** and makes the new user an admin of the EKS cluster. For a more detailed explanation, please read AWS documentation at <https://docs.aws.amazon.com/eks/latest/userguide/add-user-role.html>.

**Note:** If you would like to edit the `aws-auth ConfigMap` manually, you can run: `$ kubectl edit -n kube-system configmap/aws-auth`

## 22.0 Appendix – W Access HSOP Control Plane (regional EKS cluster)

This section describes how to access the HSOP regional control plane or the EKS cluster.

### Prerequisites:

|           |        |                                             |                 |                  |
|-----------|--------|---------------------------------------------|-----------------|------------------|
| Doc ID:   | In DMS | Document title:                             | Classification: | For internal use |
| Modified: | In DMS | Platform Service Operations and Maintenance | Author:         | In DMS           |
| Version:  | In DMS | Runbook Template                            | Approver:       | In DMS           |
| Status:   | In DMS | Template ID: SNIP-T-060007.07 (Version 1.2) | Page:           | 48 of 55         |

For Internal use only

HSOP Platform Service Operations and Maintenance Runbook

- [aws-cli version 2.2.4](#) (for all Operating Systems)
- [sshuttle 0.78.3](#) (for drawin/Linux/WSL2)
- Latest version of [OpenSSH](#) (for Windows only)
- [kubectl v1.22.3](#) (for all Operating Systems)

Note:

Access control for the EKS cluster is managed through AWS user accounts & the **aws-auth ConfigMap** in the EKS cluster. In order to access the EKS cluster you should have either the cluster\_creator role for the cluster or should be added to **aws-auth ConfigMap** with the correct kubernetes username.

Steps:

1. Establish a ssh tunnel through the desired regional bastion host as described in section [Appendix – U Setup SSH tunnel through the central Bastion host in a HSOP region](#).
2. Export AWS user account related environment variables in a terminal window.

```
export AWS_ACCESS_KEY_ID=<your aws access key id>
export AWS_SECRET_ACCESS_KEY=<your aws secret access key>
export AWS_REGION=<the aws region>
```
3. Update the local kube config file using the following command in the same terminal window.

```
aws eks update-kubeconfig --name hsop-eks-<stage>-<aws_region_short_name>
```

Upon completion of the above steps, you should be able to access the EKS cluster using kubectl commands.

```
for example
kubectl get nodes
```

23.0 Appendix – X Access central Vault instance in a region

This section describes how to access the central Vault instance in a region.

Prerequisites:

- [sshuttle 0.78.3](#) (for drawin/Linux/WSL2)
- Latest version of [OpenSSH](#) (for Windows only)

Steps:

1. Establish a ssh tunnel through the desired regional bastion host as described in section [Appendix – U Setup SSH tunnel through the central Bastion host in a HSOP region](#).
2. If you are using SOCKS proxy, update system proxy settings to use the SOCKS proxy using the below command.

```
netsh winhttp set proxy ^
proxy-server="socks=localhost:<proxy_port_number>" ^
bypass-list="localhost"
```

Alternatively, you can also update the proxy settings in your browser to use the SOCKS proxy. The specific instructions to update proxy settings is dependent on the browser used. Refer to your browser's documentation on updating proxy settings.
3. In your web browser, navigate to [https://vault.<stage>-<aws\\_region\\_short\\_name>-<apex\\_domain>/login](https://vault.<stage>-<aws_region_short_name>-<apex_domain>/login)  
Example: If stage name is <<nine>> and aws\_region\_short\_name is <<usw2>> and apex domain name is <<hsop.in>> below would be the argocd URL

|           |        |                                             |                 |                  |
|-----------|--------|---------------------------------------------|-----------------|------------------|
| Doc ID:   | In DMS | Document title:                             | Classification: | For internal use |
| Modified: | In DMS | Platform Service Operations and Maintenance | Author:         | In DMS           |
| Version:  | In DMS | Runbook Template                            | Approver:       | In DMS           |
| Status:   | In DMS | Template ID: SNIP-T-060007.07 (Version 1.2) | Page:           | 49 of 55         |

URL: <http://vault.nine-usw2.hsop.in/ui>

- Select the LDAP method for authentication & login using your HS Cloud Idap credentials.

Alternatively, you can also access Vault from the command line.

### 24.0 Appendix – Y Access ArgoCD in a region

This section describes how to access ArgoCD instance in a region.

#### Prerequisites:

- [sshuttle 0.78.3](#) (for drawin/Linux/WSL2)
- Latest version of [OpenSSH](#) (for Windows only)

#### Steps:

- Establish a ssh tunnel through the desired regional bastion host as described in section [Appendix – U Setup SSH tunnel through the central Bastion host in a HSOP region](#).
- If you are using SOCKS proxy, update system proxy settings to use the SOCKS proxy using the below command.

```
netsh winhttp set proxy ^
proxy-server="socks=localhost:<proxy_port_number>" ^
bypass-list="localhost"
```

Alternatively, you can also update the proxy settings in your browser to use the SOCKS proxy. The specific instructions to update proxy settings is dependent on the browser used. Refer to your browser's documentation on updating proxy settings.

- In your web browser, navigate to [https://argocd.<stage>-<aws\\_region\\_short\\_name>-<apex\\_domain>/login](https://argocd.<stage>-<aws_region_short_name>-<apex_domain>/login)  
Example: If stage name is <nine> and aws\_region\_short\_name is <usw2> and apex domain name is <hsop.in> below would be the argocd URL  
URL: <https://argocd.nine-usw2.hsop.in/login>
- Obtain ArgoCD admin password from central Vault instance at path [hsop/cloud/outputs/argocd\\_admin\\_password](#). See section [Appendix – X Access central Vault instance in a region](#) to access the Vault instance.
- Login to ArgoCD using the admin credentials obtained from previous step.

### 25.0 Appendix – Z Access central LDAP instance in region

This section describes how to access the central LDAP instance in a region.

#### Prerequisites:

- [sshuttle 0.78.3](#) (for drawin/Linux/WSL2)
- Latest version of [OpenSSH](#) (for Windows only)

#### Steps:

- Establish a ssh tunnel through the desired regional bastion host as described in section [Appendix – U Setup SSH tunnel through the central Bastion host in a HSOP region](#).
- If you are using SOCKS proxy, update system proxy settings to use the SOCKS proxy using the below command.

|           |        |                                                              |                 |                  |
|-----------|--------|--------------------------------------------------------------|-----------------|------------------|
| Doc ID:   | In DMS | Document title:                                              | Classification: | For internal use |
| Modified: | In DMS | Platform Service Operations and Maintenance Runbook Template | Author:         | In DMS           |
| Version:  | In DMS |                                                              | Approver:       | In DMS           |
| Status:   | In DMS | Template ID: SNIP-T-060007.07 (Version 1.2)                  | Page:           | 50 of 55         |

```
netsh winhttp set proxy ^
proxy-server="socks=localhost:<proxy_port_number>" ^
bypass-list="localhost"
```

Alternatively, you can also update the proxy settings in your browser to use the SOCKS proxy. The specific instructions to update proxy settings is dependent on the browser used. Refer to your browser's documentation on updating proxy settings.

12. In your web browser, navigate to [https://phpldapadmin.<stage>-<aws\\_region\\_short\\_name>.<apex\\_domain>/login](https://phpldapadmin.<stage>-<aws_region_short_name>.<apex_domain>/login)

Example: If stage name is <<nine>> and aws\_region\_short\_name is <<usw2>> and apex domain name is <<hsop.in>> below would be the argocd URL

URL: <https://phpldapadmin.nine-usw2.hsop.in/>

Login using your HS Cloud credentials.

## 26.0 Appendix – AA Check status of a HSOP site

This section describes how to access ArgoCD instance in a region & check the status of a HSOP site.

### Prerequisites:

- [sshuttle 0.78.3](#) (for drawin/Linux/WSL2)
- Latest version of [OpenSSH](#) (for Windows only)

### Steps:

1. Login to ArgoCD as described in section [Appendix – Y Access ArgoCD in a region](#).
2. In the Applications tab select the *microcloud* application by clicking on the card titled *microcloud*.
3. Select the site by clicking on the card with the required sitename in the title.
4. Scroll to the bottom on the page in the [LIVE MANIFEST](#) tab & verify the value of the state attribute.

## 27.0 Appendix – AB Access Cloud Foundry instance of a HSOP site

This section describes how to access Cloud Foundry instance of a HSOP site.

### Prerequisites:

- [sshuttle 0.78.3](#) (for drawin/Linux/WSL2)
- Latest version of [OpenSSH](#) (for Windows only)
- [cf cli v6](#) (for all OS)

### Steps:

1. Establish a ssh tunnel through the desired regional bastion host as described in section [Appendix – U Setup SSH tunnel through the central Bastion host in a HSOP region](#).
2. Login to Cloud Foundry using your HS Cloud LDAP credentials.

```
cf api api.cf.<sitename>.<stage>-<aws_region_short_name>.<apex_domain>
cf login
Provide your HS Cloud LDAP credentials when prompted for Email & Password
```

|           |        |                                             |                 |                  |
|-----------|--------|---------------------------------------------|-----------------|------------------|
| Doc ID:   | In DMS | Document title:                             | Classification: | For internal use |
| Modified: | In DMS | Platform Service Operations and Maintenance | Author:         | In DMS           |
| Version:  | In DMS | Runbook Template                            | Approver:       | In DMS           |
| Status:   | In DMS | Template ID: SNIP-T-060007.07 (Version 1.2) | Page:           | 51 of 55         |

### 28.0 Appendix – AC Create new Cloud Foundry Org & Space in a HSOP site

This section describes how to create a new Cloud Foundry Org & Space in a HSOP site.

#### Prerequisites:

- [sshuttle 0.78.3](#) (for drawin/Linux/WSL2)
- Latest version of [OpenSSH](#) (for Windows only)
- [cf cli v6](#) (for all OS)

#### Steps:

1. Login to the Cloud Foundry instance of a HSOP site as described in section [Appendix – AB Access Cloud Foundry instance of a HSOP site](#).
2. Run the following command to create a new Cloud Foundry Org. Skip this step if the Org already exists.

```
cf create-org <ORG_NAME>
```

3. Run the following command to create a new Cloud Foundry Space. Skip this step if the Space already exists.

```
cf create-space <SPACE_NAME> -o <ORG_NAME>
```

### 29.0 Appendix – AD Assign Cloud Foundry Org & Space roles to a User in a HSOP site

This section describes how to assign Cloud Foundry Org & Space roles to a user in a HSOP site.

#### Prerequisites:

- [sshuttle 0.78.3](#) (for drawin/Linux/WSL2)
- Latest version of [OpenSSH](#) (for Windows only)
- [cf cli v6](#) (for all OS)

#### Steps:

1. Login to the Cloud Foundry instance of a HSOP site as described in section [Appendix – AB Access Cloud Foundry instance of a HSOP site](#).
2. Run the following command to assign Org role to a user.

```
cf set-org-role <USERNAME> <ORG_NAME> <ORG_ROLE>.
ORG ROLES
OrgManager - Invite and manage users, select and change plans, and set spending limits
BillingManager - Create and manage the billing account and payment info
OrgAuditor - Read-only access to org info and reports
```

3. Run the following command to assign Space role to a user.

```
cf set-space-role <USERNAME> <ORG_NAME> <SPACE_NAME> <SPACE_ROLE>.
SPACE ROLES
SpaceManager - Invite and manage users, and enable features for a given space
SpaceDeveloper - Create and manage apps and services, and see logs and reports
SpaceAuditor - View logs, reports, and settings on this space
```

4. Repeat steps 2 & 3 to assign additional Org & Space roles to the user.

|           |        |                                             |                 |                          |
|-----------|--------|---------------------------------------------|-----------------|--------------------------|
| Doc ID:   | In DMS | Document title:                             | Classification: | For internal use         |

## 30.0 Appendix – AE AWS Resource requirement & quotas

This section outlines the AWS resources & quotas required for HSOP region & site deployments.

| Resource                | HSOP Region | HSOP Site | Quota Name                                            | Minimum Quota |
|-------------------------|-------------|-----------|-------------------------------------------------------|---------------|
| VPC                     | 2           | 1         | VPC                                                   | 20            |
| Subnets                 | 5           | 4         | Subnets                                               | 20            |
| CIDR blocks             | 4           | 3         | IPv4 CIDR blocks per VPC                              | 5             |
| Elastic IP              | 1           | 0         | Elastic IP addresses per Region                       | 5             |
| Internet gateways       | 1           | 0         | Internet gateways per Region                          | 5             |
| NAT gateways            | 5           | 2         | NAT gateways per Availability Zone                    | 20            |
| Route tables            | 7           | 4         | Route tables per VPC                                  | 20            |
| Security groups         | 5           | 3         | VPC security groups per Region                        | Default       |
| Gateway VPC endpoints   | 1           | 1         | Gateway VPC endpoints per Region                      | Default       |
| Interface VPC endpoints | 11          | 11        | Interface and Gateway Load Balancer endpoints per VPC | Default       |
| Transit gateways        | 2           | 0         | Transit gateways per VPC                              | 10            |
| TGW route tables        | 3           | 0         | Transit gateway route tables per transit gateway      | Default       |
| TGW Static routes       | 4           | 2         | Static routes per transit gateway                     | Default       |
| TGW Attachments         | 4           | 2         | Attachments per transit gateway                       | Default       |

## 31.0 Broker Service Plans not available in HSOP

HSOP brokers doesn't support high availability and cluster mode plans for brokers. Below is the list of service plans which are not available in HSOP but available in HSDP broker service plans catalogue.

| Broker                 | Plans not available in HSOP | Additional Plans in HSOP                                         |
|------------------------|-----------------------------|------------------------------------------------------------------|
| Elastic Service Broker | highmem16                   |                                                                  |
| RDS Service Broker     | *-medium-ha-dev             | postgres-5th-gen-large<br>postgres-5th-gen-xlarge<br>mysql-large |

|           |        |                                                              |                 |                  |
|-----------|--------|--------------------------------------------------------------|-----------------|------------------|
| Doc ID:   | In DMS | Document title:                                              | Classification: | For internal use |
| Modified: | In DMS | Platform Service Operations and Maintenance Runbook Template | Author:         | In DMS           |
| Version:  | In DMS |                                                              | Approver:       | In DMS           |
| Status:   | In DMS | Template ID: SNIP-T-060007.07 (Version 1.2)                  | Page:           | 53 of 55         |

## HSOP Platform Service Operations and Maintenance Runbook

|                         |                                            |          |
|-------------------------|--------------------------------------------|----------|
| Redis-DB Service Broker | redis-development-cluster<br>redis-cluster | nano-dev |
|-------------------------|--------------------------------------------|----------|

For *RabbitMQ-Server Service Broker*, the service name in HSDP is "hsdp-rabbitmq-server" whereas in HSOP it is "hsdp-rabbitmq"

### 32.0 GPU and Windows instance creation

<TODO>

### 33.0 RDS Snapshot and Restore Feature

RDS Snapshot feature operations are implemented using the velero component. So following pre-requisites are important for making the RDS snapshot feature work.

#### Pre-Requisites:

1. Ready to use kops cluster deployed with RDS service broker
2. Velero Component installed and configured in velero namespace.

#### 1. Create Manual Snapshot

##### Command:

```
cf update-service test_pg_instance -c '{"Action": "create-snapshot"}
```

#### 2. List Snapshot

##### Command:

```
cf bind-service hsdp-rds test_pg_instance_100 -b testrdsbroker -c '{"Action": "list-snapshots"}
```

#### 3. Delete Snapshot

##### Command:

```
cf update-service test_pg_instance_100 -c '{"Action": "delete-snapshot", "backupName": "postgres-e5cf12f8-48d6-4bd0-8051-09d0fba362f3-20220607101152"}
```

#### 4. Restore Snapshot

##### Command:

```
cf create-service hsdp-rds postgres-micro-dev test-pg-restore -b testrdsbroker -c '{"Action": "restore-snapshot", "backupName": "postgres-d47233df-6051-44b9-8ed3-4bfd0668886a-20220620123633"}
```
